

Propeller dimensions

The dimensions of a propeller are usually stated with two measurements, for example, 14 x 17 (this does not apply to DP propellers, the dimensions of which are stated by means of a special sizing code). The first of these two measurements refers to the diameter of the propeller – 14" (A). The second measurement refers to the pitch of the propeller – 17" (B).

Diameter

A rotating propeller describes a circle (A) – the diameter of this circle is also the diameter of the propeller.

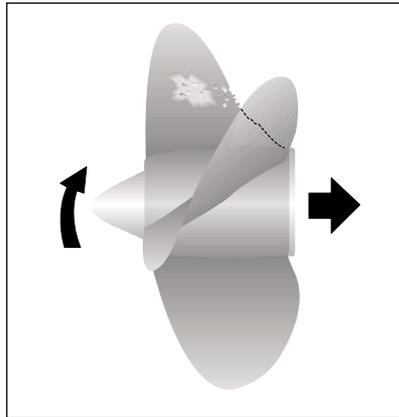

Pitch

The pitch of the propeller refers to the distance (forwards or backwards) the propeller moves in describing one complete rotation – this can simply be likened to a screw being screwed into a piece of wood! As water is not a solid substance the propeller will move some 70 to 90% of this distance, D. The remaining 10 to 30% difference is known as "slip", C.

Right hand or left hand propeller?

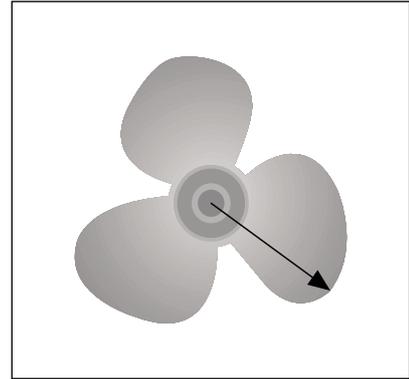

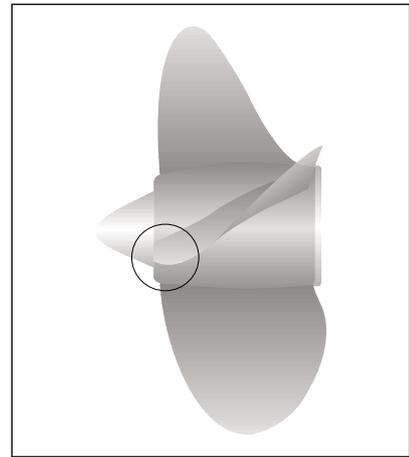

When replacing a propeller it is absolutely essential to choose the correct type of propeller. Should the propeller rotate clockwise or anti-clockwise?

The illustration shows the difference between the two.

Cavitation and cavitation corrosion

When a propeller moves through water, the water is forced against the pressure side of the propeller. The faster the propeller blades cut through the water the lower the pressure on the reverse side of the blades. At a certain speed, which varies from case to case, the pressure on the reverse side of the blade becomes so low that the water begins to "boil" – and bubbles of steam mixed with air are formed. The effect of cavitation can then be felt as the bubbles make the blades of the propeller "thicker" and increases the resistance of the water to the propeller blades thus reducing their effective performance. The bubbles of steam and air "ambulate" about the blade and when they reach a area where the water pressure is higher, they are forced together and they implode. The energy released can be compared with a water hammer that chips away fragments of the propeller blade. The resulting damage is similar to corrosion and is therefore known as cavitation corrosion. The reasons for cavitation can be many; an unevenness of the propellers leading edge, exaggerated cupping, blade edges that are too sharp or poor surface finish are a few such reasons.

Cupping

Cupping means that the trailing edges of the propeller blades have been bent in order to increase its pitch. Cupping is most suited to propellers for powerful engines and gives them a better "grip" in the water.

Measuring the diameter of a propeller

It may sometimes be difficult to find the size number on a propeller. In such cases, measure from the centre of the propeller hub to the tip of one of the blades and then multiply this figure by two.

45.3

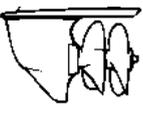

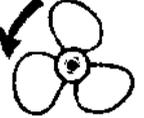

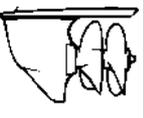

DUOPROP, TYPE C STAINLESS STEEL PROPELLERS FOR DP280, 290

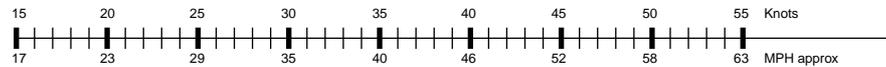

Note! Propellers with different size codes must never be mounted on the same drive! The cone is black in reality.

Note: Aluminium propellers are not approved above 48 mph on big-block engines

- D0, D1, D2, D3, D4 are recommended for all engines.
 D5, D6, D7 are recommended for following installations:
- V6 engines with gear ratio 2,3:1.
 - V6 engines with gear ratio 1,95:1 and speed below 35 knots.
 - V8 engines with speed below 35 knots.

For installations where D propellers are not recommended, the F propellers should be used. See page 75.

PROPELLERS FOR S DRIVES 110S, 120S**
Volvo Penta's S drive propellers are manufactured of aluminium or bronze alloys.

They have been developed to withstand salt water and cavitation damage. The propellers are manufactured to a high and consistent

quality under rigid quality controls. The hub is fitted with a rubber bush.

**45.53
AQUAMATIC ADAPTER PLATE**

Part no. 3851718-1. Complete adapter kit for replacing older Volvo Penta drives with SX or DP-S drives.

Adapter plate for replacing engine and drive with an engine package from Volvo Penta, or for replacing an older Volvo Penta drive with the new generation Aquamatic drive. The adapter plate minimises difficult and time-consuming glass fibre work. The adapter plate is mounted on the transom together with a rubber seal. The adapter plate is manufactured from cast aluminium and painted in the same colour as SX and DP-S drives, not for 280T.

The adapter package is suitable when replacing 250, 270, 275, 280, 285, 290 and Duoprop drives, not for 280T.

The kit contains: adapter plate, rubber seal, bolts, washers and locking nuts.

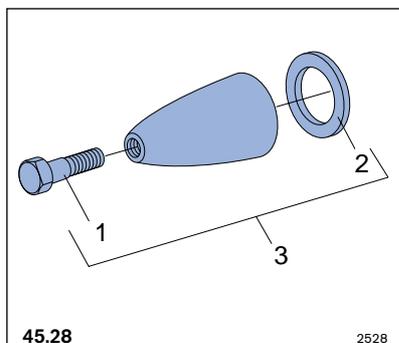

Note! Can only be combined with active electronic anti-corrosion protection kit mounted on the stern. See 30.58.

**17.17
ZINC ANODES**

Zinc and magnesium anodes protect the drive and propeller against galvanic corrosion. If 50% or more of the anode has been eaten away, the anode must be replaced. Scrape the contact surface clean to ensure good contact. Zinc and magnesium anodes must not be painted over, otherwise they will cease to function.

Note! Not for folding bronze propellers.

Anodes	Part no.	Drive
Zinc	852018-1	110S, 120S, 120SB
Magnesium	853430-7	110S, 120S, 120SB

THREE-BLADE FOLDING PROPELLER

Volvo Penta's three-blade folding propeller is a completely new type of propeller for sailboats. It combines the folding propeller's low drag under sail with reverse thrust and speed which are fully comparable with fixed propellers. We are awaiting a patent for the new design. The propeller's special features include a large blade area and unique elliptical blade profile, known as high skew, which contributes to its outstanding performance.

Safe design

Safe, simple design is another feature. A conical toothed section ensures that the propeller blades are in the correct position. With no complicated machinery or mechanisms to cause trouble, the propeller

provides superb reliability. The folding propellers are manufactured by Volvo Penta and produced according to our exacting standards. They are manufactured from a special bronze and fitted with a bushing at the hub. This absorbs the shock which the propeller and shaft are subjected to during quick shifts forwards and backwards. The three-blade folding propellers are available as Right Hand and Left Hand rotating propellers for both S drive and different shaft diameters.

Less drag

The folding propeller's greatest advantage is its low drag under sail. The three-blade folding propeller reduces drag by up to 10 times compared with a three-blade fixed propeller. It provides 4.5 times less drag than two-blade fixed propellers.

Greater Speed

The three-blade folding propeller produces an increase in speed of up to 0.6 knots compared with a two-blade folding propeller. Do you already have a fixed three-blade propeller? You don't need to worry about a loss in speed if you switch to the three-blade folding propeller. Its speed is largely comparable across the full range of revs. And what's more, the unique blade profile produces an extremely quiet and vibration-free propeller.

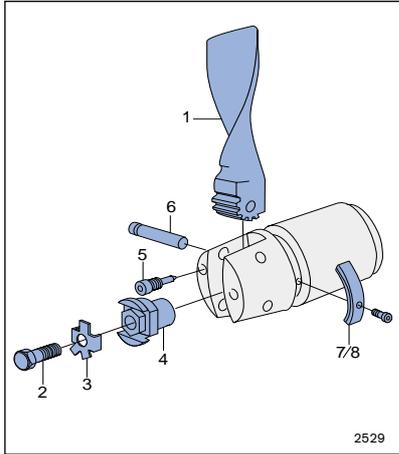

More Power

The three-blade folding propeller offers outstanding manoeuvrability. Despite being a folding propeller, reverse thrust is fully comparable with that of a fixed propeller. Compared with a two-blade folding propeller, it produces approximately twice as much reverse thrust at full throttle. At 2,000 rpm it produces nearly 30% more power.

45.12 RUBBER BUSHING FOR SP AND DP TYPE A AND TYPE B AND FOLDING BRONZE PROPELLER

Replaceable reinforced bushings are the latest example of Volvo Penta product development in propeller technology. The replaceable bushings are manufactured of high-tech rubber material with extremely high elasticity. The bushing absorbs the shock load that occurs should the propeller leave the water at speed, with rapid forward/reverse manoeuvring or when the vessel runs aground. The bushing gives a certain intentional "slip" under heavy load without any reduction in the grip of the material. Contact your dealer for more information.

FLEXIBLE PROPELLER SHAFT COUPLING

A flexible propeller shaft coupling must be used when the propeller shaft is rigidly mounted and the engine is suspended on rubber mountings. The coupling also eliminates the risk of a break between the propeller shaft and the engine with rigid engine installations. The coupling must not be combined with suspended rubber packing boxes on propeller shaft sleeves.

Part no.	Engine	Reverse gear	Flange Ø

1) To connect a shaft to this type of flexible coupling a conventional type of propeller shaft coupling, (45.32-33) is also required.

2) Pre-drilled for shaft connection.

45.32

PROPELLER SHAFT COUPLING WITH CLAMP

The coupling has an in-built coupling clamp which considerably simplifies shaft installation. It makes it possible to cut the propeller shaft to the required length and thereafter, connect it – without the necessity of machining a keyway in the shaft. Supplied complete with nuts and bolts. Propeller shaft tolerance h9 (+0.0 –0.052).

RUBBER PACKING BOX

Moulded packing box for effective lubrication/sealing. Simple, time saving installation and compact size. Minimal maintenance work – grease every 200 hours or once a year. The packing box is specifically dimensioned for Volvo Penta's propeller shafts and sleeves. For effective lubrication it is essential that the packing box bearings are water-lubricated at all speeds. Supplied complete with installation tools and grease tube.

Part no.	Shaft Ø mm	A mm	B mm	Ext. dia. shaft sleeve mm 1)

SAILING BOAT PROPELLER WITH FIXED BLADES

Volvo Penta's twin blade bronze propellers with slender blades are designed in accordance with ocean racing norms and are available in dimensions adapted to Volvo Penta's engine series. The blade/area ratio is 0.23 with a maximum blade width of 1/4 of the propeller diameter. Despite its low resistance under sail, the propeller provides excellent performance when running with the engine. The blade design of the propeller is permitted in accordance with IOR racing rules.
